

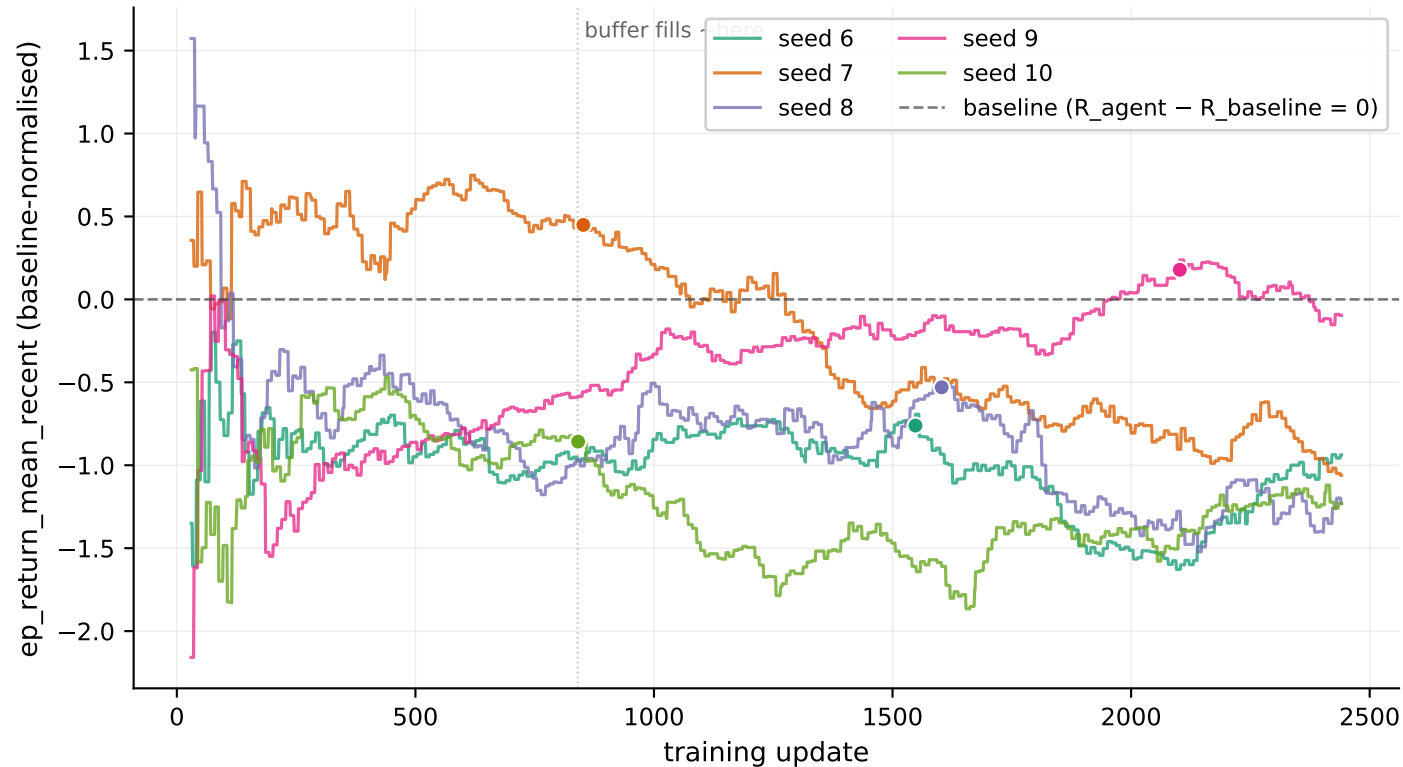

Fig 1 — Climb-then-slide in FORM on N=5 seeds {6..10}

All five seeds climb to a peak and slide back (climb-then-slide in FORM = 5/5; slide-direction confirmed universal across all five seeds). Dots mark each seed's peak update. Whether the amplitude passes $T = 0.0922$ for the climb-leg depends on the ep_init measurement window — that distinction is the subject of Fig 3.
