

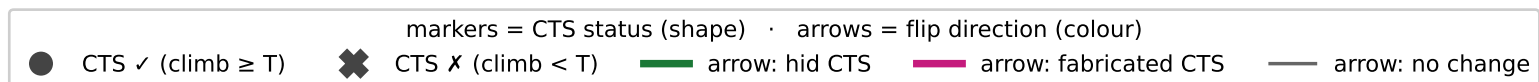

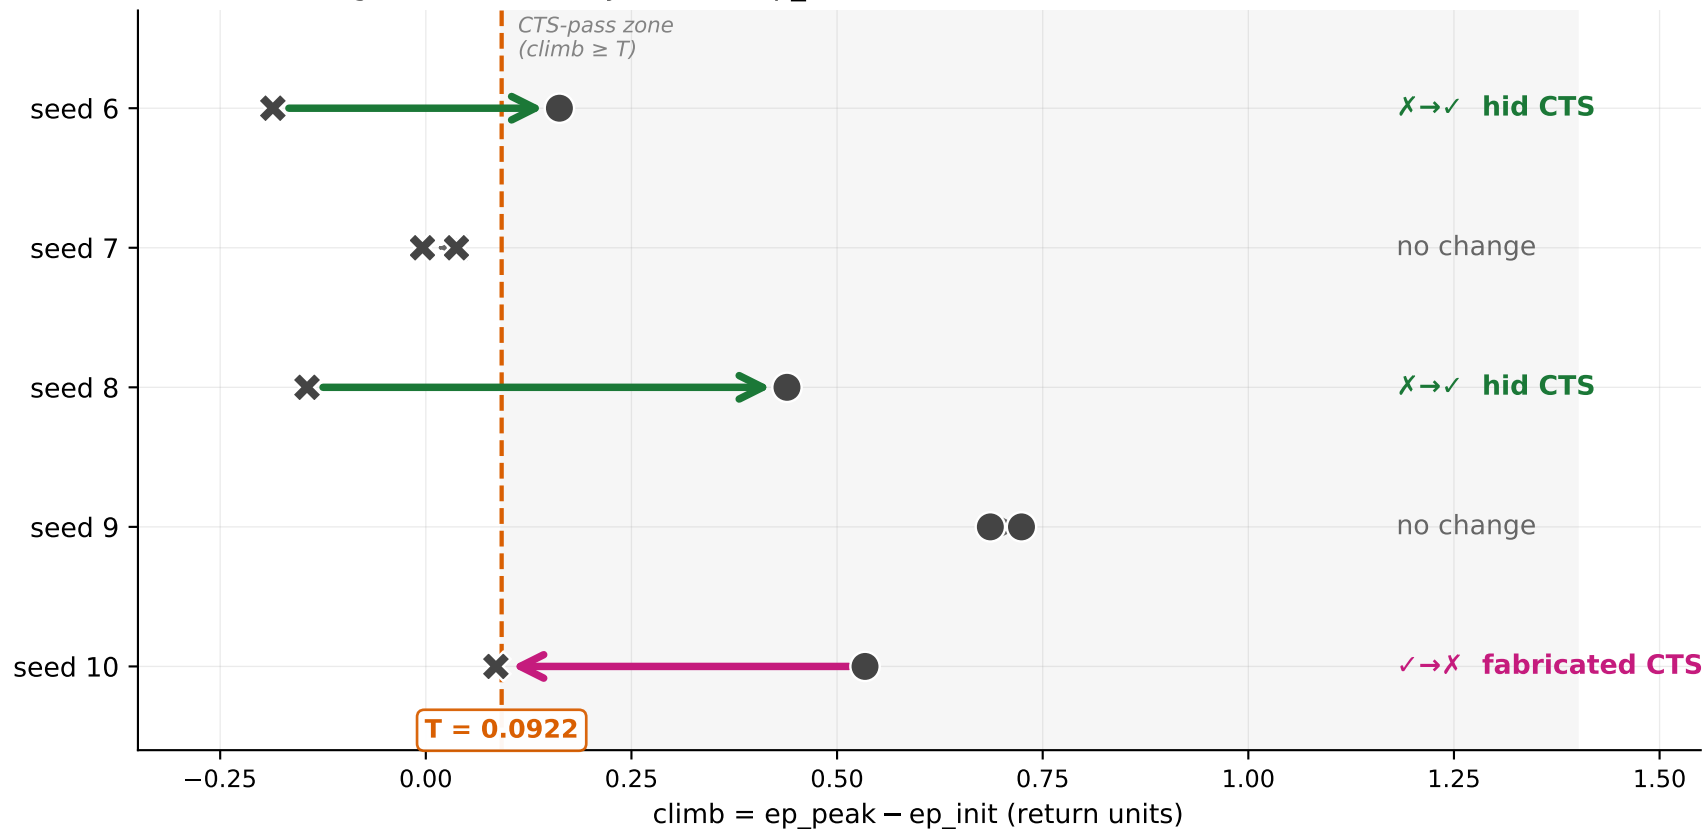

Fig 3 — Direction-symmetric ep_init-window confounder on seeds {6..10} (KEY)

Each arrow shows one seed's climb shifting between ep_init windows: tail = original [100,150] window; head = revised buffer-full window.
 The confounder lied both ways: seeds 6 and 8 had real CTS hidden by buffer noise (green, $X \rightarrow \checkmark$); seed 10's apparent CTS was a buffer-noise artefact (magenta, $\checkmark \rightarrow X$). M : 2/5 $\rightarrow$ M' : 3/5.
 Note: Fig 3 marker colours are neutral by design — the colour story here is flip direction (arrows). Fig 1's per-seed colours code seed identity, a separate scheme.
